

When switching from Nightingale X v.5.1 to v.5.2, it is necessary to remove the old prefs file so that a new one is created when Nightingale is launched. In v.5.2, there are now two prefs files. The existing one is 'Nightingale X Prefs'; it should be dragged to the trash. The new one is Nightingale_X_Prefs.txt, which for now only has a value for the sustain duration of the MIDI Pedal control.

The Nightingale X Prefs file is located in your Home/Library/Fonts Folder. (Home is inside the Users folder.) Here is a picture of what this looks like on our computer's main hard drive. A quick way to find it is to use the Finder's 'Find' command (command-F).

When using the NightCustomizer Utility, the default open command is set to find the Nightingale 2001 prefs file, which is for the classic Nightingale v.4.5. You will thus have to locate the Nightingale X Prefs file using the open dialog in order to be able to edit it. Here is what the same pathway (as above) looks like in this dialog.
